TECHNICAL BULLETIN 12-A-3

March 1, 1974

MODEL 40 AND 40 RFI SHIELDED SWITCHES

RFI grounding of the Model 40 and 40R Switches is now accomplished by a conductive coating applied to the switch body. This is similar to the RFI grounding of the LM and LMR Matrix.

The ground path starts with the RFI screen in the pushbutton and is carried to the switch body and to the ground. The foil strip, formerly used to ground the RFI screen, is no longer required and will not be included with the RFI pushbutton orders.

When ordering RFI shielded Model 40 or 40R switches, it will be necessary to specify RFI shielding for both the pushbutton and the switch assembly.
